# Generalized Eigenvalue Problem

#### Def

 $T, S \in \mathbb{R}^{n \times n}$ . We call (T, S) pencil.

We consider *only* 

symmetric and

tridiagonal

pencil.

# Generalized Eigenvalue Problem

```
Def
```

```
T,S \in \mathbb{R}^{n \times n}. We call (T,S) pencil.
```

We consider *only* symmetric and pencil.

*S* is *positive definite*.

# Generalized Eigenvalue Problem

#### Def

```
T, S \in \mathbb{R}^{n \times n}. We call (T, S) pencil.
```

We consider *only* symmetric and pencil.

S is positive definite.

# Def (Problem)

Find  $\lambda \in \mathbb{R}$  such that  $Tv = \lambda Sv$ , with  $v \in \mathbb{C}^n$ . T, S symmetric implies  $\lambda \in \mathbb{R}$ .

# Algorithm philosophy

We find zeros of the polynomial equation

$$\mathcal{F}_{(T,S)}(\lambda) = \det(T - \lambda S) = 0$$

using an iterative method, living on real line.

# Brainstorming

We want:

Fast and secure iterative method.

Starting points for our method.

Scalability.

We have: Lague

Laguerre's method.

Cuppen's divide and conquer method.

Symmetric tridiagonal matrices.

We add:

Unreducible condition.

Dynamic programming (Bottom-up).

Efficient matrix storing.

# Rapid tour

We want:

Fast and secure iterative method.

Starting points for our method.

Scalability.

We have: | Laguerre's method.

Cuppen's divide and conquer method.

Symmetric tridiagonal matrices.

We add: Unreducible condition.

Dynamic programming (Bottom-up).

Efficient matrix storing.

# Unreducible pencil

Def ( as in [?] )  $(T,S) \text{ is an } \textit{unreducible pencil if } t_{i,i+1}^2 + s_{i,i+1}^2 \neq 0$  for  $i=1,2,\ldots,n-1.$ 

# Unreducible pencil

# Def ( as in [?] )

$$(T,S)$$
 is an unreducible pencil if  $t_{i,i+1}^2 + s_{i,i+1}^2 \neq 0$  for  $i=1,2,\ldots,n-1$ .

# exemplum gratie:

Bad 
$$T = I, S = 0$$
  
 $T = I, S = I$ 

Good 
$$T = I, S = trid(-1, 2, -1)$$
  
 $T = trid(-1, 2, -1), S = trid(-1, 2, -1)$   
 $T = trid(rnd_{sub}, rnd_{diag}, rnd_{sub}), S = I,$   
with  $rnd_{sub}$  random number  $\neq 0$ .

## Matrix storin

$$T = trid(sub, diag, super)$$

But T is symmetric, so sub = super. We define and use

```
integer, parameter :: dp = kind(1.d0)
real(dp), dimension(1:n,0:1) :: T, S
```

Listing 1: T, S as couple of array

```
with T(:,0) = diag and T(:,1) = super.
```

#### Remark

We don't use T(1,1) and S(1,1).

**We want:** Fast and secure iterative method.

Starting points for our method.

Scalability.

We have: Laguerre's method.

Cuppen's divide and conquer method.

Symmetric tridiagonal matrices.

**We add:** Unreducible condition.

Dynamic programming (Bottom-up).

Efficient matrix storing.

 $\mathcal{F}_{\mathcal{T},S}(\lambda)$  is a polynomial with only real zeros; we call them

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$$

where we count with multiplicity.

 $\mathcal{F}_{T,S}(\lambda)$  is a polynomial with only real zeros; we call them

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$$

where we count with multiplicity.

If  $\lambda_m$  and  $\lambda_{m+1}$  are simple zeros (mlt=1), then we consider x between them and the quadric

 $\mathcal{F}_{T,S}(\lambda)$  is a polynomial with only real zeros; we call them

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$$

where we count with multiplicity.

If  $\lambda_m$  and  $\lambda_{m+1}$  are simple zeros (mlt=1), then we consider x between them and the quadric

$$g_u(X) = (x - X)^2 \sum_{i=1}^n \frac{(u - \lambda_i)^2}{(x - \lambda_i)^2} - (u - X)^2$$

 $\mathcal{F}_{T,S}(\lambda)$  is a polynomial with only real zeros; we call them

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$$

where we count with multiplicity.

If  $\lambda_m$  and  $\lambda_{m+1}$  are simple zeros (mlt=1), then we consider x between them and the quadric

$$g_u(X) = (x - X)^2 \sum_{i=1}^n \frac{(u - \lambda_i)^2}{(x - \lambda_i)^2} - (u - X)^2$$

if  $u \neq x$  then  $g_u(x) < 0$  and  $g_u(\lambda_m), g_u(\lambda_{m+1}) > 0$ . So we have two sign change.

 $\mathcal{F}_{T,S}(\lambda)$  is a polynomial with only real zeros; we call them

$$\lambda_1 \leq \lambda_2 \leq \cdots \leq \lambda_n$$

where we count with multiplicity.

If  $\lambda_m$  and  $\lambda_{m+1}$  are simple zeros (mlt=1), then we consider x between them and the quadric

$$g_u(X) = (x - X)^2 \sum_{i=1}^n \frac{(u - \lambda_i)^2}{(x - \lambda_i)^2} - (u - X)^2$$

if  $\lfloor u \neq x \rfloor$  then  $g_u(x) < 0$  and  $g_u(\lambda_m), g_u(\lambda_{m+1}) > 0$ . So we have two sign change.

Bolzano's Theorem tell us that there are two zeros of  $g_u$  between  $\lambda_m$  and  $\lambda_{m+1}$ . We call them  $X_-, X_+$ .

$$\lambda_m < X_- < x < X_+ < \lambda_{m+1}$$

We have one freedom: the u parameter.

Calling  $\hat{X}_- = min_u X_-$  and  $\hat{X}_+ = max_u X_+$  we can obtain

$$\lambda_m \approx \hat{X}_- < x < \hat{X}_+ \approx \lambda_{m+1}$$

and with algebraic manipulations:

$$\hat{X}_{-}, \hat{X}_{+} = L_{\pm}(x) = x + \frac{n}{-\frac{f'}{f} \pm \sqrt{(n-1)[(n-1)(-\frac{f'}{f}) - n\frac{f''}{f}]}}$$

with 
$$\frac{f'}{f} = \frac{(\mathcal{F}_{\mathcal{T},S}(\lambda))'}{\mathcal{F}_{\mathcal{T},S}(\lambda)}$$
.

So we need  $\frac{f'}{f}$  and  $\frac{f''}{f}$ .

So we need  $\frac{f'}{f}$  and  $\frac{f''}{f}$ .

This is one of the most important aspect of our calculation.

So we need  $\frac{f'}{f}$  and  $\frac{f''}{f}$ . This is one of the most important aspect of our calculation. We will see that "only" with the symmetric tridiagonal condition we can have derivatives of determinats.

It's clear how we use 
$$\lambda_m \approx \hat{X}_- < x < \hat{X}_+ \approx \lambda_{m+1}$$
 :

It's clear how we use 
$$\lambda_m \approx \hat{X}_- < x < \hat{X}_+ \approx \lambda_{m+1}$$
 : 
$$x_-^{(1)} \qquad x_0 \qquad x_+^{(1)} \qquad \cdots$$

It's clear how we use  $\lambda_m \approx \hat{X}_- < x < \hat{X}_+ \approx \lambda_{m+1}$  :

$$\begin{array}{cccc}
\lambda_m & \chi_0 & \lambda_{m+1} \\
\hline
 & \bigcirc & \bigcirc
\end{array}$$

Def (Laguerre's iteration)   
 If 
$$mlt(\lambda_m)=mlt(\lambda_{m+1})=1$$
 then 
$$x_+^{(k)}=L_+^k(x)=L_+(L_+(\dots(x_0)))$$
 
$$x_-^{(k)}=L_-^k(x)=L_-(L_-(\dots(x_0)))$$

else we have a similar expression.

# Def (Laguerre's iteration)

If 
$$mlt(\lambda_m) = mlt(\lambda_{m+1}) = 1$$
 then

$$x_{+}^{(k)} = L_{+}^{k}(x) = L_{+}(L_{+}(\dots(x_{0})))$$
  
 $x_{-}^{(k)} = L_{-}^{k}(x) = L_{-}(L_{-}(\dots(x_{0})))$ 

else we have a similar expression.

**Proof** We can prove that

$$\lambda_m \leftarrow \dots x_-^{(2)} < x_-^{(1)} < x_0 < x_+^{(1)} < x_+^{(2)} \cdots \rightarrow \lambda_{m+1}$$

# Def (Laguerre's iteration)

If  $mlt(\lambda_m) = mlt(\lambda_{m+1}) = 1$  then

$$x_{+}^{(k)} = L_{+}^{k}(x) = L_{+}(L_{+}(\dots(x_{0})))$$
  
 $x_{-}^{(k)} = L_{-}^{k}(x) = L_{-}(L_{-}(\dots(x_{0})))$ 

else we have a similar expression.

**Proof** We can prove that

$$\lambda_m \leftarrow \dots x_-^{(2)} < x_-^{(1)} < x_0 < x_+^{(1)} < x_+^{(2)} \cdots \rightarrow \lambda_{m+1}$$

So Laguerre's method is secure.

We also have un important property:

#### Teo

If we choose\*  $\lambda_m < x_0$  s.t.  $sign\Big(\frac{f'(x_0)}{f(x_0)}\Big) = sign(\lambda_m - x_0)$  then  $\{x_-^{(k)}\}_{k=1,\dots}$  converge monotonically in asymptotically cubic rate to  $\lambda_m$ .

mon. cubic to  $\lambda_{m+1}$ 

<sup>\*</sup>for  $x_0 < \lambda_{m+1}$  s.t.  $sign\Big(\frac{f^{'}(x_0)}{f(x_0)}\Big) = sign(\lambda_m - x_0)$  we have  $\{x_+^{(k)}\}_{k=1,...}$  conv.

We also have un important property:

#### Teo

If we choose\*  $\lambda_m < x_0$  s.t.  $sign\Big(\frac{f'(x_0)}{f(x_0)}\Big) = sign(\lambda_m - x_0)$  then  $\{x_-^{(k)}\}_{k=1,\dots}$  converge monotonically in asymptotically cubic rate to  $\lambda_m$ .

So we can exactly define a neighborhood "near"  $\lambda$  and in it we have cubic rate convergence (much, much faster then simple bisection)

mon. cubic to  $\lambda_{m+1}$ 

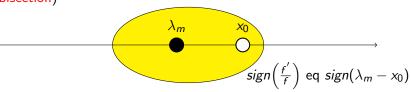

<sup>\*</sup>for  $x_0 < \lambda_{m+1}$  s.t.  $sign\left(\frac{f^{'}(x_0)}{f(x_0)}\right) = sign(\lambda_m - x_0)$  we have  $\{x_+^{(k)}\}_{k=1,\dots}$  conv.

We also have un important property:

#### Teo

If we choose\*  $\lambda_m < x_0$  s.t.  $sign\Big(\frac{f'(x_0)}{f(x_0)}\Big) = sign(\lambda_m - x_0)$  then  $\{x_-^{(k)}\}_{k=1,\dots}$  converge monotonically in asymptotically cubic rate to  $\lambda_m$ .

So we can exactly define a neighborhood "near"  $\lambda$  and in it we have cubic rate convergence (much, much faster then simple bisection)

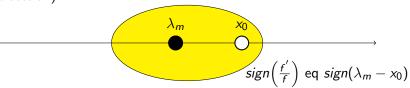

<sup>\*</sup>for  $x_0 < \lambda_{m+1}$  s.t.  $sign\left(\frac{f'(x_0)}{f(x_0)}\right) = sign(\lambda_m - x_0)$  we have  $\{x_+^{(k)}\}_{k=1,\dots}$  conv. mon. cubic to  $\lambda_{m+1}$ 

We also have un important property:

#### Teo

If we choose\*  $\lambda_m < x_0$  s.t.  $sign\Big(\frac{f'(x_0)}{f(x_0)}\Big) = sign(\lambda_m - x_0)$  then  $\{x_-^{(k)}\}_{k=1,\dots}$  converge monotonically in asymptotically cubic rate to  $\lambda_m$ .

So we can exactly define a neighborhood "near"  $\lambda$  and in it we have cubic rate convergence (much, much faster then simple bisection)

The Laguerre's method is fast.

<sup>\*</sup>for  $x_0 < \lambda_{m+1}$  s.t.  $sign\left(\frac{f'(x_0)}{f(x_0)}\right) = sign(\lambda_m - x_0)$  we have  $\{x_+^{(k)}\}_{k=1,\dots}$  conv. mon. cubic to  $\lambda_{m+1}$ 

It's clear that we need a powerfull method to obtain  $x_0$  and an algorithm to estimate  $mlt(\lambda_m)$ .

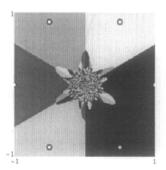

Overstimate  $mlt(\lambda_m)$  (as we can read in [?]) causes no trouble, so the most importan aspects of our calculation are:

Good  $x_0$ .

Good evaluation of  $L_{\pm}(x)$ .

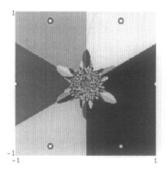

# Complex case (little digression)

According to [?], we observe that searching  $z \in \mathbb{C}$  such that  $z^n-1=0$  for n>4 with Laguerre's method it's difficult because near the origin there is a Julia fractal set for starting point  $z_0$ . (figure: n=6)

# Complex case (little digression)

According to [?], we observe that searching  $z \in \mathbb{C}$  such that  $z^n-1=0$  for n>4 with Laguerre's method it's difficult because near the origin there is a Julia fractal set for starting point  $z_0$ . (figure: n=6)

So if we want to solve the Generalized Eigenvalues Problem with  $T, S \in \mathbb{C}$  we have great problems to place the starting point if n > 4.

## Three term recurrence

For a generic  $x \in \mathbb{R}$  we call  $\rho_n(x) = \det(T_n - xS_n)$ , and  $\rho_{n-1}(x) = \det(T_{n-1} - xS_{n-1})$ , with  $T_{n-1}$  leading principal submatrix.

We have

$$\begin{split} \rho_0 &:= 1 \text{ , } \rho_1 := t_{1,1} - x s_{1,1} \\ \rho_i &:= (t_{i,i} - x s_{i,i}) \rho_{i-1} - (t_{i-1,i} - x s_{i-1,i})^2 \rho_{i-2} \text{ , } i = 2, 3, \dots, n \end{split}$$

## Three term recurrence

We can proove it with the Laplace expansion (e.g. n = 4)

$$T_{4} - xS_{4} = \begin{pmatrix} a & b & 0 & 0 \\ b & c & d & 0 \\ 0 & d & e & f \\ 0 & 0 & f & g \end{pmatrix}$$

$$det (T_{4} - \lambda S_{4}) = g \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & d & e \end{bmatrix} - f \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & 0 & f \end{bmatrix}$$

$$= g \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & d & e \end{bmatrix} - f^{2} \begin{bmatrix} a & b \\ b & c \end{bmatrix}$$

We can proove it with the Laplace expansion (e.g. n = 4)

$$T_{4} - xS_{4} = \begin{pmatrix} a & b & 0 & 0 \\ b & c & d & 0 \\ 0 & d & e & f \\ 0 & 0 & f & g \end{pmatrix}$$

$$det(T_{4} - \lambda S_{4}) = g \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & d & e \end{bmatrix} - f \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & 0 & f \end{bmatrix}$$

$$= g \begin{bmatrix} a & b & 0 \\ b & c & d \\ 0 & d & e \end{bmatrix} - f^{2} \begin{bmatrix} a & b \\ b & c \end{bmatrix}$$

#### Remark

have

If 
$$x = \lambda$$
 then  $\rho_n(\lambda) = \mathcal{F}_{(T_n,S_n)}(\lambda) = f(\lambda)$ 

Remark ( important results with proof in Appendice)  $\rho_0, \rho_1, \ldots, \rho_n$  is a *Sturm sequence* of polynomials so,  $\forall x \in \mathbb{R}$ , we

$$\kappa(x) := \#$$
 eigenvalues less then  $x$ 
 $\kappa(x) = \#$  consecutive sign changes in  $\{\rho_i\}_{i=0,\dots,n}$ 

Obviusly 
$$f' = \rho'_n, f'' = \rho''_n$$
.

Obviusly 
$$f^{'}=\rho_{n}^{'}, f^{''}=\rho_{n}^{''}.$$
 So\*

$$\mathsf{IF}\,\left(\kappa(\mathsf{x}_0) \geq m \;\mathsf{AND}\; -\frac{f'}{f} < 0\right) \;\mathsf{OR}\,\left(\kappa(\mathsf{x}_0) < m \;\mathsf{AND}\; -\frac{f'}{f} \geq 0\right) \;\mathsf{THEN}$$

Obviusly 
$$f' = \rho'_n$$
,  $f'' = \rho''_n$ . So\*

$$\mathsf{IF}\,\left(\kappa(\mathsf{x}_0) \geq m\;\mathsf{AND}\; -\frac{f'}{f} < 0\right)\;\mathsf{OR}\;\left(\kappa(\mathsf{x}_0) < m\;\mathsf{AND}\; -\frac{f'}{f} \geq 0\right)\;\mathsf{THEN}$$

We have cubic convergence in Laguerre's method with  $x_0$  as starting point.

with bisection we can find the neighbourhood of  $\lambda_m$ 

we can now use the Laguerre's iteration

We define 
$$\xi_i = \frac{\rho_i}{\rho_{i-1}}$$
 for  $i = 2, \dots, n$  and we have  $\rho_i = \prod_{k=1}^n \xi_k$ .

We define  $\xi_i = \frac{\rho_i}{\rho_{i-1}}$  for  $i=2,\ldots,n$  and we have  $\rho_i = \prod_{k=1}^n \xi_k$ . We also define  $\eta_i = \frac{\rho_i'}{\rho_i}, \zeta_i = \frac{\rho_i''}{\rho_i}$  for  $i=0,1,\ldots,n$  and we finally we have

$$\kappa(x) = \text{ number of negative terms in } \{\xi_i\}_{i=1}^n$$
 
$$-\frac{f'(x)}{f(x)} = \eta_n$$
 
$$\frac{f''(x)}{f(x)} = \zeta_n$$

So we have to calculate three three-term-recurrences.

So we have to calculate three three-term-recurrences. Total = 2 + 38n multiplications.

So we have to calculate three three-term-recurrences.

Total = 2 + 38n multiplications.

For every step in Laguerre's iteration we have to do 2+7+38n multiplications and 1 square root extraction. Because the convergence is cubic we hope in a small number of iteration.

It's a common knowledge that three-term-recurrences suffer from severe overflow and underflow problems, and because of the we use  $\xi_i$  instead of  $\rho_i$ :

It's a common knowledge that three-term-recurrences suffer from severe overflow and underflow problems, and because of the we use  $\xi_i$  instead of  $\rho_i$ :

$$\xi_i = \frac{\rho_i}{\rho_{i-1}}$$
, it's self-scaled.

$$\xi_i = \frac{\rho_i}{\rho_{i-1}}$$
, it's self-scaled.

Teo

$$f[f(x)] = f[det[T - xS]] = (1 + \gamma)det[(T + \delta T) - x(S + \delta S)]$$

where  $|\gamma| \leq n\epsilon$ , with  $\epsilon$  machine precision, and both  $\delta T$  and  $\delta S$  are symmetric tridiagonal matrices satisfying entrywise inequalities  $|\delta T|_{\infty} \leq 2.51\epsilon |T|_{\infty} + \sqrt{\epsilon_u}, |\delta S|_{\infty} \leq 3.51\epsilon |S|_{\infty}$ , where  $\epsilon_u$  is the underflow threshold (in double precision is  $10^{-308}$ ).

We are interested not only in  $\mathrm{fl}[f(x)]=\mathrm{fl}\Big[\prod_{i=1}^n\mathrm{fl}[\xi_i]\Big]$ , but also in  $\mathrm{fl}[\eta_n]$  and  $\mathrm{fl}[\zeta_n]$ , because we use these three value to colculate the Laguerre's iteration.

We are interested not only in  $\mathrm{fl}[f(x)]=\mathrm{fl}\Big[\prod_{i=1}^n\mathrm{fl}[\xi_i]\Big]$ , but also in  $\mathrm{fl}[\eta_n]$  and  $\mathrm{fl}[\zeta_n]$ , because we use these three value to colculate the Laguerre's iteration.

The authors doesn't report this important aspect of analysis.

### Searching initial points

**We want:** Fast and secure iterative method.

Starting points for our method.

Scalability.

We have: Laguerre's method.

Cuppen's divide and conquer method.

Symmetric tridiagonal matrices.

**We add:** Unreducible condition.

Dynamic programming (Bottom-up).

Efficient matrix storing.

If n=1 we have  $t\cdot v=\lambda\cdot s\cdot v.$   $s\neq 0$ , so  $\lambda=\frac{t}{s}$ .

If 
$$n=1$$
 we have  $t\cdot v=\lambda\cdot s\cdot v$ .  $s\neq 0$ , so  $\lambda=\frac{t}{s}$ . If  $n=2$  we have  $\begin{bmatrix} t_{1,1} & t_{1,2} \\ t_{2,1} & t_{2,2} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \lambda \begin{bmatrix} s_{1,1} & s_{1,2} \\ s_{2,1} & s_{2,2} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix}$ 

If n=1 we have  $t\cdot v=\lambda\cdot s\cdot v$ .  $s\neq 0$ , so  $\lambda=\frac{t}{s}$ . If n=2 we have  $\begin{bmatrix} t_{1,1} & t_{1,2} \\ t_{2,1} & t_{2,2} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \lambda \begin{bmatrix} s_{1,1} & s_{1,2} \\ s_{2,1} & s_{2,2} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix}$  calling\*

$$S^{-1}T = \delta^{-1} \cdot \begin{pmatrix} \alpha & \gamma \\ \gamma & \beta \end{pmatrix}$$

we resolve  $det[S^{-1}T - \lambda I] = 0$  with

$$\lambda_{1,2} = \frac{1}{2\delta} \left( \alpha + \beta \pm \sqrt{\alpha^2 + \beta^2 + \gamma^2 - \alpha\beta} \right)$$

$$\frac{}{}^*\alpha = s_{2,2}t_{1,1} - s_{1,2}t_{1,2}, \beta = -s_{1,2}t_{1,2} + s_{1,1}t_{2,2} 
\gamma = -s_{1,2}t_{1,2} + s_{1,1}t_{1,2}, \delta = s_{1,1}s_{2,2} - s_{1,2}^2.$$

And if n = 4?

$$\begin{pmatrix} t_{1,1} & t_{1,2} & 0 & 0 \\ t_{2,1} & t_{2,2} & t_{2,3} & 0 \\ 0 & t_{3,2} & t_{3,3} & t_{3,4} \\ 0 & 0 & t_{4,3} & t_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix} = \lambda \begin{pmatrix} s_{1,1} & s_{1,2} & 0 & 0 \\ s_{2,1} & s_{2,2} & s_{2,3} & 0 \\ 0 & s_{3,2} & s_{3,3} & s_{3,4} \\ 0 & 0 & s_{4,3} & s_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix}$$

And if n = 4?

$$\begin{pmatrix} t_{1,1} & t_{1,2} & 0 & 0 \\ t_{2,1} & t_{2,2} & t_{2,3} & 0 \\ 0 & t_{3,2} & t_{3,3} & t_{3,4} \\ 0 & 0 & t_{4,3} & t_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix} = \lambda \begin{pmatrix} s_{1,1} & s_{1,2} & 0 & 0 \\ s_{2,1} & s_{2,2} & s_{2,3} & 0 \\ 0 & s_{3,2} & s_{3,3} & s_{3,4} \\ 0 & 0 & s_{4,3} & s_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix}$$

And if n = 4?

$$\begin{pmatrix} t_{1,1} & t_{1,2} & 0 & 0 \\ t_{2,1} & t_{2,2} & 0 & 0 \\ 0 & 0 & t_{3,3} & t_{3,4} \\ 0 & 0 & t_{4,3} & t_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix} = \lambda \begin{pmatrix} s_{1,1} & s_{1,2} & 0 & 0 \\ s_{2,1} & s_{2,2} & 0 & 0 \\ 0 & 0 & s_{3,3} & s_{3,4} \\ 0 & 0 & s_{4,3} & s_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix}$$

And if n = 4?

$$\begin{pmatrix} t_{1,1} & t_{1,2} & 0 & 0 \\ t_{2,1} & t_{2,2} & \mathbf{0} & 0 \\ 0 & \mathbf{0} & t_{3,3} & t_{3,4} \\ 0 & 0 & t_{4,3} & t_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix} = \lambda \begin{pmatrix} s_{1,1} & s_{1,2} & 0 & 0 \\ s_{2,1} & s_{2,2} & \mathbf{0} & 0 \\ 0 & \mathbf{0} & s_{3,3} & s_{3,4} \\ 0 & 0 & s_{4,3} & s_{4,4} \end{pmatrix} \begin{pmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{pmatrix}$$

We can solve the blue part and obtain  $\mu_1, \mu_2$ , the cyan part and obtain  $\mu_3, \mu_4$ .

From  $\mu_j$  we can enter in our "neighbourhood" of  $\lambda_j$  using simple bisection:

<sup>\*</sup>This is the most important part of our method.

From  $\mu_j$  we can enter in our "neighbourhood" of  $\lambda_j$  using simple bisection:

Speudocode:

```
set a_j = 0 and b_j = \mu_j

set x = \mu_j

# IF \kappa(x) < j

THEN set a_j = x

ELSE set b_j = x

*IF -\frac{f'(x)}{f(x)} = sign(\lambda_j - x)

THEN stop

ELSE set x = \frac{b_j - a_j}{2} and go to #
```

Authors of [?, ?] doesn't explain this point.

<sup>\*</sup>This is the most important part of our method.

$$x_0^1, L(x_0^1), L(L(x_0^1)), \cdots \rightsquigarrow \lambda_1$$

$$x_0^2, L(x_0^2), L(L(x_0^2)), \cdots \rightsquigarrow \lambda_2$$
Hopefully we have
$$x_0^3, L(x_0^3), L(L(x_0^3)), \cdots \rightsquigarrow \lambda_3$$

$$x_0^4, L(x_0^4), L(L(x_0^4)), \cdots \rightsquigarrow \lambda_4$$

Consider  $(\hat{T}, \hat{S})$  with

$$\hat{T} = \begin{pmatrix} T_0 & 0 \\ 0 & T_1 \end{pmatrix}$$

$$\hat{S} = \begin{pmatrix} S_0 & 0 \\ 0 & S_1 \end{pmatrix}$$

with  $T_0, T_1, S_0, S_1$  symmetric tridiagonal, and let be

$$\hat{\lambda}_1 \leq \hat{\lambda}_2 \leq \dots \leq \hat{\lambda}_n$$

eigenvalues of  $(\hat{T}, \hat{S})$ , they are what we call  $\mu_1, \ldots, \mu_n$ .

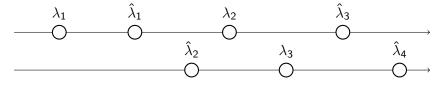

Teo (A sort of "interlacing" with ▶ proof)

$$-\infty < \lambda_1 \le \hat{\lambda}_1$$
$$\hat{\lambda}_{i-1} \le \lambda_i \le \hat{\lambda}_{i+1}$$
$$\hat{\lambda}_n \le \lambda_n < \infty$$

with i = 2, 3, ..., n - 1.

#### Remark

It's possible that

Teo (A sort of "interlacing" with ▶ proof)

$$-\infty < \lambda_1 \le \hat{\lambda}_1$$
$$\hat{\lambda}_{i-1} \le \lambda_i \le \hat{\lambda}_{i+1}$$
$$\hat{\lambda}_n \le \lambda_n < \infty$$

with i = 2, 3, ..., n - 1.

#### Remark

It's possible that

### Remark

Our method is monotonic

#### Remark

Our method is monotonic

We can reach  $\lambda_2$  only from  $\hat{\lambda}_2$ , moving from left to right (and similar  $\lambda_3$  only from  $\hat{\lambda}_3$ , moving from right to left).

#### Remark

Our method is monotonic

We can reach  $\lambda_2$  only from  $\hat{\lambda}_2$ , moving from left to right (and similar  $\lambda_3$  only from  $\hat{\lambda}_3$ , moving from right to left). If  $|\lambda_2 - \lambda_3| < 10^{-14}$  we can have trobles.

#### Remark

Our method is monotonic

We can reach  $\lambda_2$  only from  $\hat{\lambda}_2$ , moving from left to right (and similar  $\lambda_3$  only from  $\hat{\lambda}_3$ , moving from right to left).

If  $|\lambda_2 - \lambda_3| \le 10^{-14}$  we can have trobles.

Luckily we also have a multiplicity estimator (called EstMlt) that works only with  $\hat{\lambda}_1, \ldots, \hat{\lambda}_n$ 

#### Remark

Our method is monotonic

We can reach  $\lambda_2$  only from  $\hat{\lambda}_2$ , moving from left to right (and similar  $\lambda_3$  only from  $\hat{\lambda}_3$ , moving from right to left).

If  $|\lambda_2 - \lambda_3| \le 10^{-14}$  we can have trobles.

Luckily we also have a *multiplicity estimator* (called EstMlt) that works only with  $\hat{\lambda}_1, \dots, \hat{\lambda}_n$ .

If mlt=2 then we consider  $\lambda_2=\lambda_3$ , i.e. we said that  $\lambda_2$  has multiplicity 2.

### **EstMIt**

We have j, x,  $\operatorname{sgn}\left(-\frac{f'(x)}{f(x)}\right)$  and  $\hat{\lambda}_1, \dots, \hat{\lambda}_n$  as *INPUT*.

### Speudocode:

```
mlt = 1
do k = 1,...

m = j + k \operatorname{sgn}\left(-\frac{f'(x)}{f(x)}\right)
 if m \leq 0 then
 something goes wrong
  go to #
 end if
 if |\hat{\lambda}_j - \hat{\lambda}_m| \leq 0.01 |\hat{\lambda}_j - x| then
 mlt = mlt + 1
 else go to #
  end if
```

# Appendice A: proof of Laguerre's convergence

According to [?, p.444] we can write

$$x_{\pm}^{(k+1)} = x_{\pm}^{(k)} - \frac{nf}{f' \pm H^{\frac{1}{2}}}$$

$$H = (n-1)^2 (f')^2 - n(n-1)ff''$$

If we choose the sign so that the  $|f'\pm H^{\frac{1}{2}}|$  has the larger absolute value then we can approx  $x_+^{(k+1)}-\lambda_m$  as

$$x_{\pm}^{(k+1)} - \lambda_m \approx \frac{1}{2} (x_{\pm}^{(k)} - \lambda_m)^3 \frac{(n-1)\Sigma_2' - (\Sigma_1')^2}{n-1}$$

$$\Sigma_2' = \sum_{i \neq n} \frac{1}{(\lambda_m - \lambda_i)^2}$$

$$\Sigma_1' = \sum_{i \neq n} \frac{1}{\lambda_m - \lambda_i}$$

### Appendice A: proof of Laguerre's convergence

So we have convergence and  $x_{\pm}^{(k+1)} - \lambda_m \approx \text{number } (x_{\pm}^{(k)} - \lambda_m)^3$  tell us that the convergence is cubic.

### Appendice B: proof of property about Sturm sequence

#### Def

For  $\alpha \in [0,1]$  we define the pencil  $(T(\alpha), S(\alpha)) := ((1-\alpha)\hat{T} + \alpha T, (1-\alpha)\hat{S} + \alpha S).$ 

#### Lemm

 $(T(\alpha), S(\alpha))$  is a symmetric definite pencil for each  $\alpha \in [0, 1]$ . Calling  $\lambda_1(\alpha) \le \lambda_2(\alpha) \le \cdots \le \lambda_n(\alpha)$  the n real eigenvalues of the pencil  $(T(\alpha), S(\alpha))$  we have

#### Lemm

Each  $\lambda_i(\alpha)$  is a continuous function of  $\alpha \in [0,1]$ .

Teo (A sort of "interlacing")

$$-\infty < \lambda_1 \le \hat{\lambda}_1$$
$$\hat{\lambda}_{i-1} \le \lambda_i \le \hat{\lambda}_{i+1}$$
$$\hat{\lambda}_n \le \lambda_n < \infty$$

with 
$$i = 2, 3, ..., n - 1$$
.

Teo (A sort of "interlacing")

$$-\infty < \lambda_1 \le \hat{\lambda}_1$$
$$\hat{\lambda}_{i-1} \le \lambda_i \le \hat{\lambda}_{i+1}$$
$$\hat{\lambda}_n \le \lambda_n < \infty$$

with i = 2, 3, ..., n - 1.

Classic interlacing still works for  $-\infty < \lambda_1 \le \hat{\lambda}_1$  and for  $\hat{\lambda}_n \le \lambda_n < \infty$ .

Teo (A sort of "interlacing")

$$-\infty < \lambda_1 \le \hat{\lambda}_1$$
$$\hat{\lambda}_{i-1} \le \lambda_i \le \hat{\lambda}_{i+1}$$
$$\hat{\lambda}_n \le \lambda_n < \infty$$

with i = 2, 3, ..., n - 1.

Classic interlacing still works for  $-\infty < \lambda_1 \le \hat{\lambda}_1$  and for  $\hat{\lambda}_n \le \lambda_n < \infty$ .

We have to proove that  $\lambda_i \geq \hat{\lambda}_{i-1}$  (and similar  $\lambda_i \leq \hat{\lambda}_{i+1}$ ).

```
(Proof by contradiction) if we consider \lambda_i < \hat{\lambda}_{i-1} for some i \in \{2, 3, ..., n-1\} (that, in our new writing, is \lambda_i(1) < \lambda_{i-1}(0) because all \lambda_j(1) are eigenvalues of (T, S) and all \lambda_j(0) are eigenvalues of (\hat{T}, \hat{S})) then
```

(Proof by contradiction) if we consider  $\lambda_i < \hat{\lambda}_{i-1}$  for some  $i \in \{2,3,\ldots,n-1\}$  (that, in our new writing, is  $\lambda_i(1) < \lambda_{i-1}(0)$  because all  $\lambda_j(1)$  are eigenvalues of (T,S) and all  $\lambda_j(0)$  are eigenvalues of  $(\hat{T},\hat{S})$ ) then

(Proof by contradiction) if we consider  $\lambda_i < \hat{\lambda}_{i-1}$  for some  $i \in \{2,3,\ldots,n-1\}$  (that, in our new writing, is  $\lambda_i(1) < \lambda_{i-1}(0)$  because all  $\lambda_j(1)$  are eigenvalues of (T,S) and all  $\lambda_j(0)$  are eigenvalues of  $(\hat{T},\hat{S})$ ) then

$$\lambda_{i}(1)$$
  $\lambda_{i}(0)$   $\lambda_{i-1}(1)$   $\lambda_{i-1}(0)$ 

in symbols:  $\lambda_{i-1}(1) \leq \lambda_i(1) < \lambda_{i-1}(0) \leq \lambda_i(0)$ .

(Proof by contradiction) if we consider  $\lambda_i < \hat{\lambda}_{i-1}$  for some  $i \in \{2, 3, \dots, n-1\}$  (that, in our new writing, is  $\lambda_i(1) < \lambda_{i-1}(0)$  because all  $\lambda_j(1)$  are eigenvalues of (T, S) and all  $\lambda_j(0)$  are eigenvalues of  $(\hat{T}, \hat{S})$ ) then

in symbols:  $\lambda_{i-1}(1) \leq \lambda_i(1) < \lambda_{i-1}(0) \leq \lambda_i(0)$ . For all  $\tilde{\lambda} \in [\lambda_i(1), \lambda_{i-1}(0)]$  we can find  $\alpha_i, \alpha_{i-1}$  such as  $\tilde{\lambda} = \lambda_i(\alpha_i) = \lambda_{i-1}(\alpha_{i-1})$ .

$$H(\alpha, \lambda) := det[T(\alpha) - \lambda S(\alpha)] =$$

$$\begin{bmatrix} \vdots & \vdots & \vdots \\ \alpha(t_{k,k+1} - s_{k,k+1}) & t_{k,k} - \lambda s_{k,k} \\ \alpha(t_{k,k+1} - s_{k,k+1}) & t_{k+1,k+1} - \lambda s_{k+1,k+1} \end{bmatrix}$$
